SNOWFLAKE COCO CLI HACKATHON 2026 | GCC EDITION

RelateIQ

Customer 360 + Next Best Action Engine

Turn fragmented borrower signals into the right action, today.

- Team Name: Ratnesh Saxena (Solo)
- Problem Statement: PS2 — Customer 360 and Next Best Action Engine
- Team Leader: Ratnesh Saxena
- Team Size: 1

02 / PROBLEM BRIEF

The Problem: Arjun Guesses Every Morning

- Arjun Mehta, Relationship Manager at a digital lender, oversees 2,000 retail borrowers.
- Every morning he must answer: which customers need attention TODAY, and exactly what to do about each one.
- Today he guesses. The cost: disputes get dunned (relationships torched), churners slip away unnoticed, upsell windows close before anyone acts.
- The gap: structured account data and unstructured conversation signals (calls, emails) live in separate worlds — no single customer view exists.
- Key stat: 2,000 borrowers · 1 manager · 0 single view of the customer.

03 / ARCHITECTURE

How It Works

- DATA SOURCES: Accounts | Transactions | Repayment History | Credit Utilization | Tenure + Call Transcripts | Support Emails | KYC / Document Notes
- SNOWFLAKE CUSTOMER 360 LAYER: governed semantic views over structured + unstructured data; SQL + Cortex-ready; auditable decision tables.
- SKILL 1 — 360 PROFILER: fuses structured signals into Attention (0–100) + Opportunity (0–100) scores. Deterministic, explainable weighted scoring.
- SKILL 2 — SIGNAL READER: extracts intent from unstructured touchpoints: churn-risk, dispute-open, complaint, life-event, upsell-window.
- SKILL 3 — NEXT-BEST-ACTION ORCHESTRATOR: six decision branches (dispute-hold, churn callback, collections gentle/firm, retention offer, pre-approved upsell); drafts outreach; append-only audit write.
- STREAMLIT APP: Priority Feed (rank) · Customer 360 (diagnose) · Action Queue (approve). Demo mode offline / Live mode Snowflake with graceful fallback.

04 / COCO CLI SKILLS

Three Modular Skills, One Pipeline

- 1. 360-profiler — in: accounts, transactions, repayments, credit, tenure — out: Attention + Opportunity scores + reasoning trace (.coco/skills/360-profiler/SKILL.md)
- 2. signal-reader — in: call_transcripts.md, support_emails.md — out: intent signal + CLEAR/HOLD clearance (.coco/skills/signal-reader/SKILL.md)
- 3. next-best-action-orchestrator — in: scores + signals + DPD — out: action + reason + drafted outreach + audit row (.coco/skills/next-best-action-orchestrator/SKILL.md)
- Connection: profiler output feeds orchestrator branch thresholds; signal-reader gates branches (dispute-open forces dispute-hold with zero outreach).
- Every decision appends exactly one row to the audit table — never UPDATE, never DELETE.

05 / IMPACT STATEMENT

From Guesswork to a Ranked Queue in Seconds

- Speed: a 40-customer portfolio is profiled, signal-scanned and action-queued in seconds; the same engine scales to Arjun's full 2,000-borrower book.
- Risk eliminated: dispute-hold guarantees zero dunning of customers with open disputes (the Amit Verma case).
- Revenue protected + grown: churn-intervention callbacks target high-LTV at-risk customers (Vikram Rao); pre-approved top-ups surface exactly when utilization and score qualify (Kavya Nair).
- Trust by design: every score shows its reasoning trace; every decision carries its reason; every approved action lands in an append-only audit table.
- Projected outcomes: delinquency down through earlier, correctly-toned collections; upsell conversion up through perfectly timed offers.

06 / ROADMAP

What Comes Next

- 1. Live Snowflake wiring: run sql/01_schema.sql + sql/02_load.py, flip the toggle, validate Demo/Live score parity.
- 2. Cortex Analyst in production: ship the relateiq_model semantic model for plain-language portfolio questions.
- 3. Real signal ingestion: replace markdown fixtures with a nightly pipeline from call-recording and ticketing systems.
- 4. Pilot with one RM team: measure dispute-dun rate, callback conversion and upsell uptake vs a control group for one quarter.
- 5. Expand the branch library: EMI restructuring, referral offers and more as new data becomes available.
- Closing line: Arjun no longer guesses. He just opens the feed.
